conceptual model

**processing  
algorithms**

**image**

visual channel  
retinal variables

**mapping**

visual encoding

visual metaphor

**Data**

# Data models vs. Conceptual models

---

## Data models are low level descriptions of the data

- Math: Sets with operations on them
- Example: integers with + and operators

## Conceptual models are mental constructions

- Include semantics and support reasoning

## Examples (data vs. conceptual)

- (1D floats) vs. Temperature
- (3D vector of floats) vs. Space

# Taxonomy

---

- 1D (sets and sequences)
- Temporal
- 2D (maps)
- 3D (shapes)
- nD (relational)
- Trees (hierarchies)
- Networks (graphs)

**Are there others?**

The eyes have it: A task by data type taxonomy for information visualization [Schneiderman 96]

# Types of variables

---

## Physical types

- Characterized by storage format
- Characterized by machine operations

### Example:

bool, short, int32, float, double, string, ...

## Abstract types

- Provide descriptions of the data
- May be characterized by methods/attributes
- May be organized into a hierarchy

### Example:

plants, animals, metazoans, ...

# Nominal, ordinal and quantitative

---

## **N - Nominal (labels)**

- Fruits: Apples, oranges, ...

## **O - Ordered**

- Quality of meat: Grade A, AA, AAA

## **Q - Interval (Location of zero arbitrary)**

- Dates: Jan, 19, 2006; Location: (LAT 33.98, LONG -118.45)
- Like a geometric point. Cannot compare directly
- Only differences (i.e. intervals) may be compared

## **Q - Ratio (zero fixed)**

- Physical measurement: Length, Mass, Temp, ...
- Counts and amounts
- Like a geometric vector, origin is meaningful

# From data model to data type

---

## Data model

- 32.5, 54.0, -17.3, ...
- floats

## Conceptual model

- Temperature

## Data type

- Burned vs. Not burned (N)
- Hot, warm, cold (O)
- Continuous range of values (Q)

**Image**

# Visual language is a sign system

---

Jacques Bertin

**Images perceived as a set of signs**

**Sender encodes information in signs**

**Receiver decodes information from signs**

**Semiology of Graphics, 1983**

# LES VARIABLES DE L'IMAGE

	POINTS			LIGNES			ZONES	
XY 2 DIMENSIONS DU PLAN								
Z TAILLE								
VALEUR								

# LES VARIABLES DE SÉPARATION DES IMAGES

GRAIN								
COULEUR								
ORIENTATION								
FORME								

# Information in position

---

1. A, B, C are distinguishable
  2. B is between A and C.
  3. BC is twice as long as AB.
- ∴ Encode quantitative variables  
(Q)

"Resemblance, order and proportional are the three signfields in graphics." - Bertin

# Information in color and value

---

**Value is perceived as ordered**

**∴ Encode ordinal variables (O)**

**∴ Encode continuous variables (Q) [not as well]**

**Hue is normally perceived as unordered**

**∴ Encode nominal variables (N) using color**

# Visual variables

- Position
- Size
- Value
- Texture
- Color
- Orientation
- Shape

LES VARIABLES DE L'IMAGE									
		POINTS			LIGNES			ZONES	
XY	2 DIMENSIONS DU PLAN	x	x	x	/	~	/	15 9	18 2
Z	TAILLE	■	■	■	/	~	/	■	■
	VALEUR	■	■	■	/	~	/	■	■
LES VARIABLES DE SÉPARATION DES IMAGES									
	GRAIN	■	■	■	/	~	/	■	■
	COULEUR	■	■	■	/	~	/	■	■
	ORIENTATION	■	■	■	/	~	/	■	■
	FORME	■	■	■	/	~	/	■	■

Note: Bertin does not consider 3D or time

Note: Card and Mackinlay extend the number of vars.

# Bertins' "Levels of Organization"

---

<b>Position</b>	<b>N</b>	<b>O</b>	<b>Q</b>
-----------------	----------	----------	----------

<b>Size</b>	<b>N</b>	<b>O</b>	<b>Q</b>
-------------	----------	----------	----------

<b>Value</b>	<b>N</b>	<b>O</b>	<b>Q</b>
--------------	----------	----------	----------

<b>Texture</b>	<b>N</b>	<b>o</b>	
----------------	----------	----------	--

<b>Color</b>	<b>N</b>		
--------------	----------	--	--

<b>Orientation</b>	<b>N</b>		
--------------------	----------	--	--

<b>Shape</b>	<b>N</b>		
--------------	----------	--	--

**N** Nominal

**O** Ordered

**Q** Quantitative

**Note: Q < O < N**

**Note: Bertin actually breaks visual variables down into differentiating ( $\neq$ ) and associating ( $\equiv$ )**

# Detection

# Detecting brightness

---

Which is brighter?

# Detecting brightness

---

(128, 128, 128)

(144, 144, 144)

Which is brighter?

# Just noticeable difference

---

## JND (Weber's Law)

$$\Delta S = k \frac{\Delta I}{I}$$

- Ratios more important than magnitude
- Most continuous variations in stimuli are perceived in discrete steps

# Estimating Magnitude

# Steven's power law

$$S = I^p$$

$p < 1$  : underestimate  
 $p > 1$  : overestimate

[graph from Wilkinson 99, based on Stevens 61]

# Exponents of power law

---

<b>Sensation</b>	<b>Exponent</b>
<b>Loudness</b>	<b>0.6</b>
<b>Brightness</b>	<b>0.33</b>
<b>Smell</b>	<b>0.55 (Coffee) - 0.6 (Heptane)</b>
<b>Taste</b>	<b>0.6 (Saccharine) -1.3 (Salt)</b>
<b>Temperature</b>	<b>1.0 (Cold) – 1.6 (Warm)</b>
<b>Vibration</b>	<b>0.6 (250 Hz) – 0.95 (60 Hz)</b>
<b>Duration</b>	<b>1.1</b>
<b>Pressure</b>	<b>1.1</b>
<b>Heaviness</b>	<b>1.45</b>
<b>Electric Shock</b>	<b>3.5</b>

[Psychophysics of Sensory Function, Stevens 61]
